EDUCATION

Deakin University **Burwood, VIC**

Bachelor of Computer Science (Majored in Data Science) *Graduation Date: Jun 2026*

***Certifications**: Data Analysis with python (freeCodeCamp), Intro to C++ (LCC Computer Education)*

WORK EXPERIENCE

Superstat **Richmond, VIC**

Computer Vision and sports analytics Intern *July 2025 - Sep 2025*

- **Annotated** and validated **2,000+ AFL gameplay frames** using CVAT, applying compact bounding boxes and event tagging (goals, tackles, disposals) to improve accuracy of early-stage player and ball tracking.
- **Collaborated** with the AI team to design a **player classification model** leveraging jersey color features, achieving **~90% accuracy** across varied datasets through instance segmentation and feature extraction.
- Built and optimized a **jersey number recognition model**, reaching **95%+ accuracy**, directly supporting automated player identification for downstream analytics.
- **Streamlined** data structuring and feature tagging processes, enabling faster model training cycles and providing validated inputs for proprietary performance analytics tools.

LEADERSHIP EXPERIENCE

Redback Operations (Project Orion) **Burwood, VIC**

Team Lead – Sports Analytics & Annotation *July 2025 - Sep 2025*

- Directed a **5-member analytics team** to deliver a scalable AFL annotation pipeline, coordinating task breakdowns, deadlines, and integration with frontend/backend teams.
- Designed and led a **training program on AFL rules and gameplay**, enabling non-expert annotators to accurately tag events; improved annotation consistency by **30%+** across the dataset.
- Oversaw creation of a comprehensive **event glossary and annotation schema**, standardizing kick, mark, and tackle definitions for **10,000+ frames** used in player tracking model training.
- Collaborated cross-functionally with machine learning and software engineering teams, ensuring annotated datasets directly supported **event detection and tracking models** with measurable accuracy gains.

PROJECT EXPERIENCE

Distributed Music Recommendation System

- **Developed** a distributed recommendation engine using Python and Spotify API, **utilizing** collaborative and content-based filtering algorithms to recommend tracks based on user preferences.
- **Collected** and pre-processed audio features from playlists, **standardizing** metrics like tempo, energy, and danceability for analysis.
- **Achieved** a 38% reduction in execution time by **parallelizing** the recommendation process with MPI across multiple nodes.

SKILLS

Programming: Python, R, SQL, HTML/CSS, JavaScript, C, C++, C#; familiar with TensorFlow, Keras, Scikit-learn, OpenCV, Vue.js, RESTful APIs.

Software & Tools: Power BI, MySQL, Excel, Jupyter Notebook, Git, Docker, Google Cloud Storage, Roboflow, CVAT; visualization libraries (Matplotlib, Seaborn, ggplot2).
